Subject: الف

نوبت شماره 6

الف در قسمت الف $front = 5$ هست که یعنی صف از خانه 6

شروع می شود و در خانه 12 به پایان می رسد پس 7 عنصر دارد.

ب در قسمت ب $front = 12$ هست یعنی ابتدای صف خانه

13 می باشد و در خانه 5 که مقدار rear هست به پایان

می رسد پس 8 عنصر دارد.

ج $(rear + front - \text{طول آرایه}) \% \text{طول آرایه} + 1$

حلقه $\left\{ \begin{array}{ll} r - f & rear > front \\ n - |r - f| & rear < front \end{array} \right.$

سؤال 2

- 1- pop 5 from S and push it to R
- 2- pop 4 from S and push it to R
- 3- pop 9 from T and push it to R
- 4- pop 8 from T and push it to R
- 5- pop 7 from T and push it to R
- 6- pop 6 from T and push it to R

کلاس ها:

program : وظیفه اجرایی برنامه و فراخوانی توابع

node : کلاسی برای ساختن node و گره ها.

پیوندی ها:

- data از نوع int

- next از نوع node برای اشاره به گره بعد

- previous از نوع node برای اشاره به گره قبل

متدها:

- Constructor : برای set کردن متدها

- Deep Copy : کپی گرفتن از obj با تغییر آدرس

Doubly Linked List : برای ساختن لیست دوسره

برو برای ها :

- head از نوع node برای اشاره به ابتدای لیست
- tail از نوع node برای اشاره به انتهای لیست

همه ها :

- **IsEmpty** : برای تست خالی بودن لیست
- **InsertAtLast** : برای اضافه کردن به انتهای لیست
- **show Backward** : برای نمایش برعکس لیست مان
- اگر صف شل است به کار می رود.
- **IsNot Empty** : برای تست خالی نبودن لیست
- **swap Reference** : برای تعویض prev و next
